4.4 Add Activity Button	4
4.5 Activity List	4
64.6 Delete Button.....	4
5.0 Screenshots of the App	5
6.0 Conclusion	8

1.0 Introduction

Mobile applications are widely used to help users manage daily tasks and activities efficiently. This project involves developing a simple Daily Activities Recorder App using Flutter. The app allows users to add, view, and delete daily activities in an organized manner. The purpose of this assignment is to apply basic Flutter concepts such as user input handling, state management using `setState()`, and displaying data using lists. The application is designed to be simple, user-friendly, and suitable for beginners in mobile app development.

2.0 Objective

The objective of this assignment is to develop a simple Flutter mobile application that allows users to record their daily activities. The application helps users enter an activity name, add a time or category, view all saved activities, and delete activities from the list. This project also demonstrates basic Flutter concepts such as `StatefulWidget`, `TextField`, `Button`, `ListView`, `Card`, and `setState` for updating the interface.

3.0 Description of the System

The Daily Activities Recorder App is a beginner-friendly mobile application created using Flutter. It stores activities temporarily in memory using a `List`. Each activity contains two pieces of information: the activity name and the time or category. Users can add new activities by filling in the input fields and pressing the Add Activity button. The activities are displayed in a list on the screen. Users can also delete any activity from the list using the delete button. The system does not use an external database or advanced state management. It uses `setState` to refresh the interface whenever an activity is added or deleted.

4.0 Explanation of the Interface

The interface of the Daily Activities Recorder App is simple and easy to understand. It contains the following main parts:

4.1 App Bar

The App Bar is displayed at the top of the screen. It shows the title "Daily Activities Recorder", which helps users identify the purpose of the application.

4.2 Activity Input Field

The activity input field allows users to type the name of the activity they want to record. For example, the user can enter activities such as "Study", "Exercise", "Reading", or "Cooking". This field is required before adding an activity to the list.

4.3 Time or Category Input Field

The time or category input field allows users to enter extra information about the activity. For example, the user can enter a time such as "8:00 PM" or a category such as "Exercise". This makes each activity more descriptive and easier to understand.

4.4 Add Activity Button

The Add Activity button is used to add the entered activity to the list. When the user taps this button, the app checks the input fields, saves the activity in the List, updates the screen using `setState`, and clears the input fields for the next activity.

4.5 Activity List

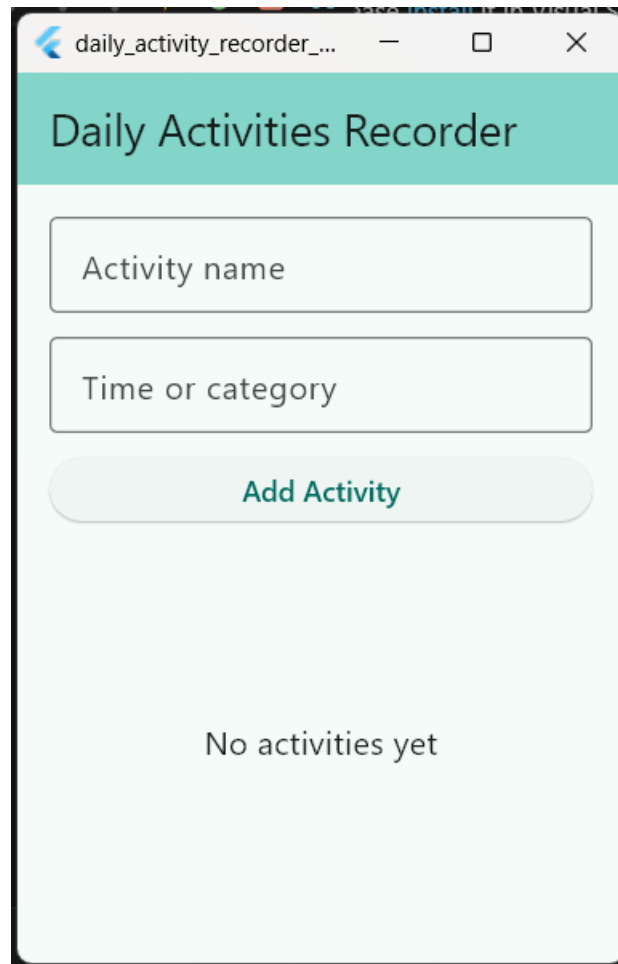

The activity list displays all activities that the user has added. Each activity is shown in a simple card format. The card displays the activity name and its time or category. If there are no activities, the app displays the message "No activities yet".

64.6 Delete Button

The delete button appears beside each activity in the list. When the user taps the delete button, the selected activity is removed from the List. The screen is then updated using `setState` so the deleted activity no longer appears.

5.0 Screenshots of the App

The interface of the Daily Activities Recorder App is simple and easy to understand. It contains the following main parts:

Screenshot 1: Home screen showing empty activity list

daily_activity_recorder_... — □ ×

Daily Activities Recorder

Activity name

Time or category

Add Activity

Study
8:00 am 

Screenshot 2: Screen after entering an activity name and time/category

Activity name

Study

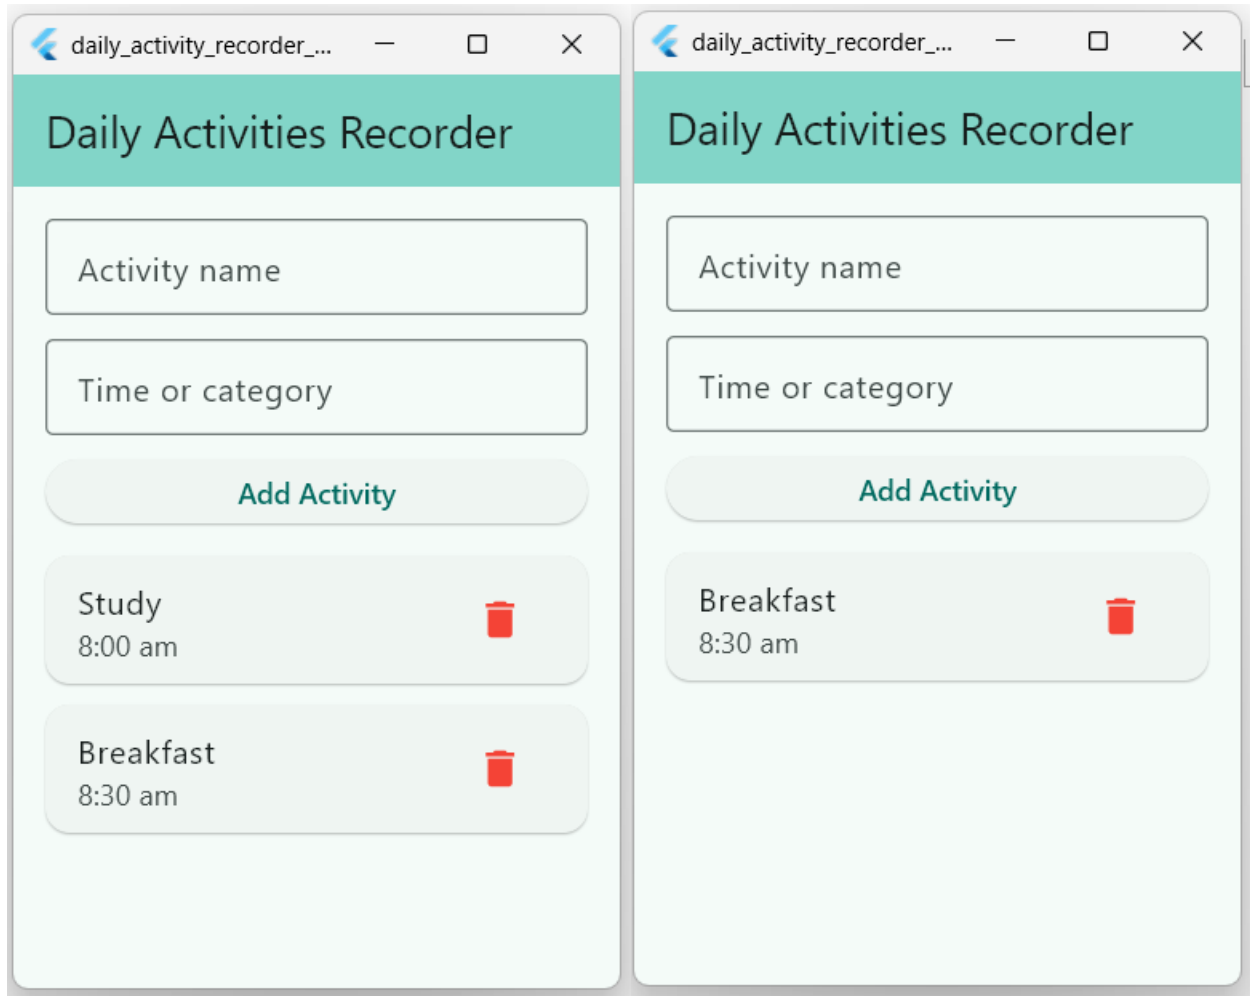

Time or category

8:00 am

Add Activity

No activities yet

Screenshot 3: Screen showing added activities in the list

Screenshot 4: Screen after deleting an activity

6.0 Conclusion

In conclusion, the Daily Activities Recorder App is a simple Flutter application that allows users to record and manage daily activities. It uses basic Flutter widgets and simple state management with `setState`. The app meets the main requirements by allowing users to enter activities, add them to a list, display them on the screen, and delete them when needed. This project is useful for beginners because it demonstrates how to build a functional mobile application using simple Flutter concepts.
