

Lab 1: Packet analysis at application layer using Wireshark

SCSR1213 Network Communications

Universiti Teknologi Malaysia

Objective:

1. Understanding of network protocols by observing the sequence of messages exchanged between two protocol entities, delving down into the details of protocol operation, and causing protocols to perform certain actions and then observing these actions and their consequences.
2. To introduce student with Wireshark software tool for packet analyzer.
3. To analyze protocol used in application layer such as http and dns.

Reference material: Computer Networking: A Top-Down Approach, 7th ed., J.F. Kurose and K.W. Ross.

Name :TAN ZHI MING

Metric No :A23CS0189

Section :02

Mark

PART A: Wireshark Getting Started

1.0 Introduction

The basic tool for observing the messages exchanged between executing protocol entities is called a **packet sniffer**. As the name suggests, a packet sniffer captures (“sniffs”) messages being sent/received from/by your computer; it will also typically store and/or display the contents of the various protocol fields in these captured messages. A packet sniffer itself is passive. It observes messages being sent and received by applications and protocols running on your computer, but never sends packets itself. Similarly, received packets are never explicitly addressed to the packet sniffer. Instead, a packet sniffer receives a *copy* of packets that are sent/received from/by application and protocols executing on your machine.

Figure A.1 shows the structure of a packet sniffer. At the right of Figure 1 are the protocols (in this case, Internet protocols) and applications (such as a web browser or ftp client) that normally run on your computer. The packet sniffer, shown within the dashed rectangle in Figure A.1 is an addition to the usual software in your computer, and consists of two parts. The **packet capture library** receives a copy of every link-layer frame that is sent from or received by your computer. In Figure A.1, the assumed physical media is an Ethernet, and so all upper-layer protocols are eventually encapsulated within an Ethernet frame. Capturing all link-layer frames thus gives you all messages sent/received from/by all protocols and applications executing in your computer.

Figure A.1: Packet sniffer structure

The second component of a packet sniffer is the **packet analyzer**, which displays the contents of all fields within a protocol message. In order to do so, the packet analyzer must “understand” the structure of all messages exchanged by protocols. The packet analyzer understands the format of Ethernet frames, and so can identify the IP datagram within an Ethernet frame. It also understands the IP datagram format, so that it can extract the TCP segment within the IP datagram. Finally, it understands the TCP segment structure, so it can extract the HTTP message contained in the TCP segment. Finally, it understands the HTTP protocol and so, for example, knows that the first bytes of an HTTP message will contain the string “GET,” “POST,” or “HEAD”.

2.0 Getting Wireshark Ready

- Download and install the Wireshark software
- Run Wireshark. Wireshark startup screen shown in Figure A.2.

Figure A.2: Initial Wireshark startup screen

- The Wireshark interface has five major components as shown in Figure A.3.

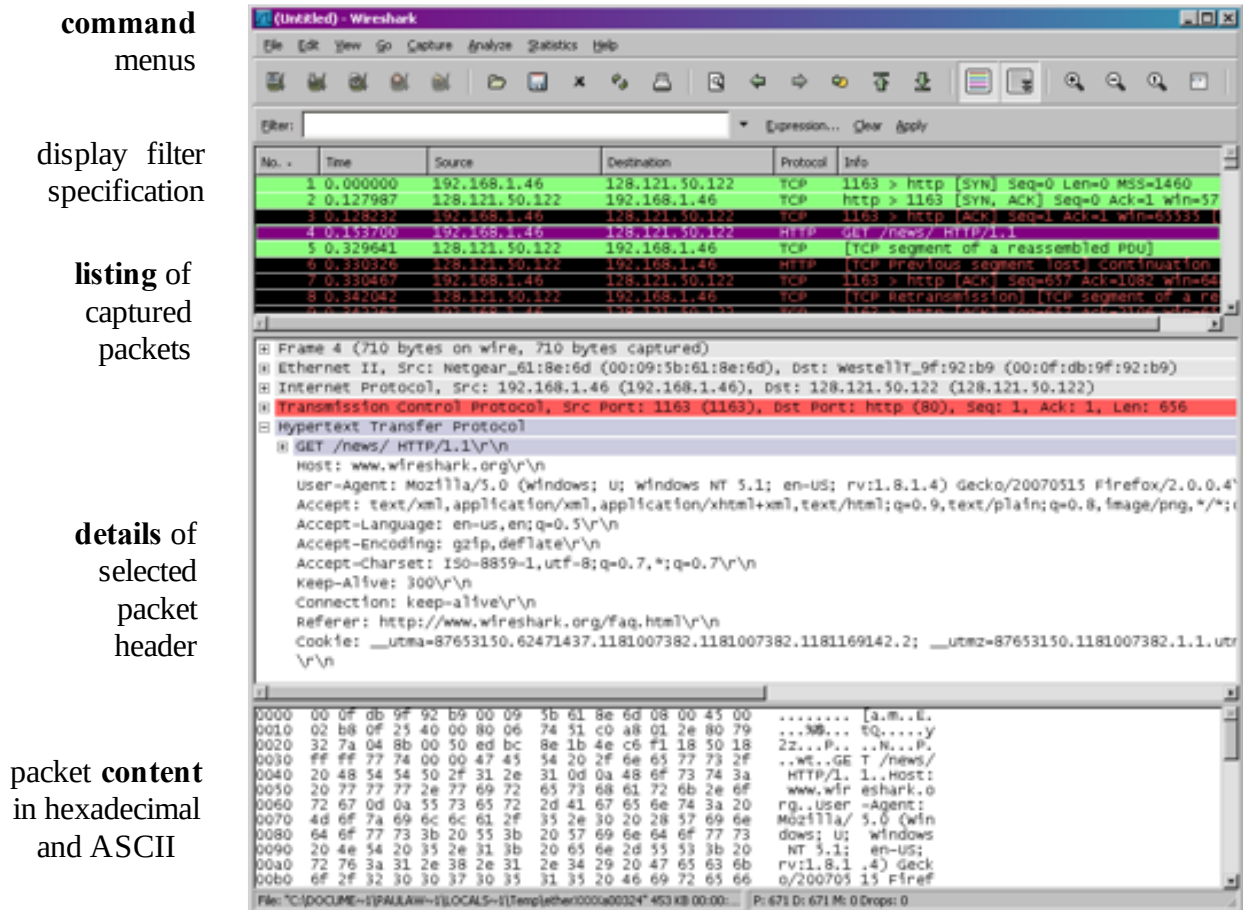

Figure A.3: Wireshark Graphical User Interface, during packet capture and

- The **command menus** are standard pulldown menus located at the top of the window.
- The **packet display filter field**, into which a protocol name or other information can be entered in order to filter the information displayed in the packet-listing window.
- The **packet-listing window** displays a one-line summary for each packet captured, including the packet number, the time at which the packet was captured, the packet's source and destination addresses, the protocol type, and protocol-specific information contained in the packet.
- The **packet-header details window** provides details about the packet selected (highlighted) in the packet-listing window. These details include information about the Ethernet frame and IP datagram that contains this packet. The amount of Ethernet and IP-layer detail displayed can be expanded or minimized by clicking on the plus minus boxes to the left of the Ethernet frame or IP datagram line in the packet details window. If the packet has been carried over TCP or UDP, TCP or UDP details will also be displayed, which can similarly be expanded or minimized. Finally, details about the highest-level protocol that sent or received this packet are also provided.
- The **packet-contents window** displays the entire contents of the captured frame, in both ASCII and hexadecimal format.

3.0 Test Run Wireshark

- Start up the Wireshark software.
- To begin packet capture, select the Capture pull down menu and pick Options menu. Select appropriate interfaces on your compute and click Start button to begin packet capture. Refer to Figure A.4

Figure A.4: Capture and Options Menu

- Once you begin packet capture, result will be shown as in Figure A.5.

The image shows the Wireshark interface with a packet capture in progress. The top pane displays a list of 90 captured packets. The middle pane shows the details of the selected packet (No. 107), and the bottom pane shows the raw packet data in hexadecimal and ASCII.

No.	Time	Source	Destination	Protocol	Length	Info

```

Figure A.5: Wireshark packet capture result

- By selecting Capture pulldown menu and selecting Stop, you can stop packet capture.

- Type “arp” in packet display filter field and press Enter key. This will cause only ARP message to be displayed in the packet-listing window as shown in Figure A.6.

Figure A.6: ARP packet capture

- To save the trace result, use File pulldown menu and select Save function as shown in Figure A.7.

Figure A.7: Save Wireshark trace result

PART B: HTTP Trace

In this part, we'll explore several aspects of the HTTP protocol: the basic GET/response interaction, HTTP message formats and retrieving HTML files with embedded objects. Before beginning these labs, you might want to review Section 2.2 of the textbook.

B.1 The Basic HTTP GET/response interaction

- Open packet trace file **lab1-http-B01.pcapng**.
- Enter “**http**” (just the letters, not the quotation marks) in the **packet display filter field**, so that only captured HTTP messages will be displayed later in the packet-listing window. Refer to figure below:

packet display filter

- By looking at the information in the HTTP GET and response messages, answer the following questions:
 1. What version of HTTP is the server running?
[HTTP Version is HTTP/1.1](#)
 2. What is the IP address of the client computer?
[192.168.1.102](#)
 3. What is the IP address of the gaia.cs.umass.edu server?
[128.119.245.12](#)
 4. How many bytes of content are being returned to client browser?
[439 bytes](#)
 5. What is the status code returned from the server to client browser?
[200 OK, means that the server successfully process the request from the client and returned the requested resource](#)

B.2 The HTTP CONDITIONAL GET/response interaction

- Open packet trace file **lab1-http-B02.pcapng**.
- By looking at the information in the HTTP GET and response messages, answer the following questions:

1. Inspect the contents of the first HTTP GET request from your browser to the server. Do you see an “IF-MODIFIED-SINCE” line in the HTTP GET?

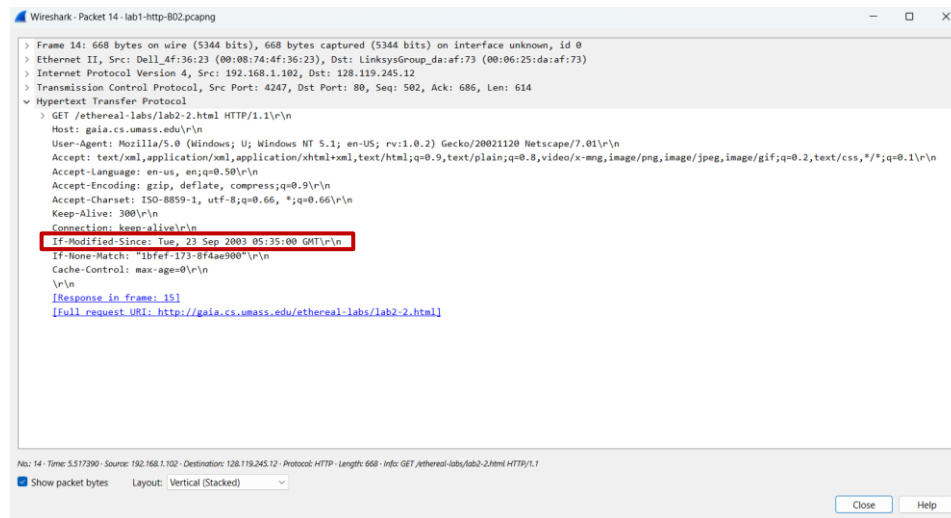

No, I do not see an “IF-MODIFIED-SINCE” line in the HTTP GET.

2. Inspect the contents of the server response after the first GET request from client. Did the server explicitly return the contents of the file? How can you tell?

Yes, the server explicitly returns the contents of the file because it shows the status code 200 OK which indicates the server successfully returned the requested contents.

- Now inspect the contents of the second HTTP GET request from your browser to the server. Do you see an “IF-MODIFIED-SINCE:” line in the HTTP GET? If so, what information follows the “IF-MODIFIED-SINCE:” header?

The image shows a Wireshark packet capture window titled "Wireshark - Packet 14 - lab1-http-802.pcapng". The packet list on the left shows "GET /etherreal-labs/lab2-2.html HTTP/1.1". The packet details pane on the right shows the structure of the HTTP request. The "Hypertext Transfer Protocol" section is expanded, showing the request headers. The "If-Modified-Since" header is highlighted with a red box, showing its value as "Tue, 23 Sep 2003 05:35:00 GMT". Other headers visible include "Host: gaia.cs.umass.edu", "User-Agent: Mozilla/5.0 (Windows; U; Windows NT 5.1; en-US; rv:1.0.2) Gecko/20021120 Netscape/7.01", "Accept: text/xml,application/xml,application/xhtml+xml,text/html;q=0.9,text/plain;q=0.8,video/x-mng,image/png,image/jpeg,image/gif;q=0.2,*/*;q=0.1", "Accept-Language: en-us,en;q=0.50", "Accept-Encoding: gzip, deflate, compress;q=0.9", "Accept-Charset: ISO-8859-1, utf-8;q=0.66,*;q=0.66", and "Keep-Alive: 300". The status bar at the bottom indicates "No: 14 - Time: 5.517390 - Source: 192.168.1.102 - Destination: 128.119.245.12 - Protocol: HTTP - Length: 668 - Info: GET /etherreal-labs/lab2-2.html HTTP/1.1".

Yes, I see an “IF-MODIFIED-SINCE:” and the information follows that it is TUE, 23 Sep “2003 05:35:00 GMT”, which means that if the resource on the server had been modified after the specified date, then the server will respond with 200 OK status and send the updated content to browser.

- What is the HTTP status code and phrase returned from the server in response to this second HTTP GET? Did the server explicitly return the contents of the file? Explain.

The image shows a Wireshark packet capture window titled "Wireshark - Packet 15 - lab1-http-802.pcapng". The packet list on the left shows "HTTP/1.1 304 Not Modified". The packet details pane on the right shows the structure of the HTTP response. The "Hypertext Transfer Protocol" section is expanded, showing the response headers. The status line "HTTP/1.1 304 Not Modified" is highlighted with a red box. Other headers visible include "Date: Tue, 23 Sep 2003 05:35:53 GMT", "Server: Apache/2.0.40 (Red Hat Linux)", "Connection: Keep-Alive", "Keep-Alive: timeout=10, max=99", and "ETag: \"1bfef-173-8f4ae900\"". The status bar at the bottom indicates "No: 15 - Time: 5.540216 - Source: 128.119.245.12 - Destination: 192.168.1.102 - Protocol: HTTP - Length: 243 - Info: HTTP/1.1 304 Not Modified".

The HTTP status code is 304 Not Modified. The server didn't explicitly return the contents of the file because it determined that the file had not modified since the date provided in "IF-MODIFIED-SINCE" header.

B.3 HTML Documents with Embedded Objects

- Open packet trace file **lab1-http-B03.pcapng**.
- By looking at the information in the HTTP GET and response messages, answer the following questions:

1. How many HTTP GET request messages did client browser send?

The image shows a Wireshark packet capture window titled 'lab1-http-B03.pcapng'. The 'http' filter is applied. The packet list shows several HTTP messages. The first three are GET requests from 192.168.1.102 to various destinations: 128.119.245.12 (HTTP 1.1), 165.193.123.218 (HTTP 1.1), and 134.241.6.82 (HTTP 1.1). The fourth packet is a 200 OK response from 192.168.1.102 to 128.119.245.12.

No.	Time	Source	Destination	Protocol	Length	Info
10	7.236929	192.168.1.102	128.119.245.12	HTTP	555	GET /etherreal-labs/lab2-4.html HTTP/1.1
12	7.260813	128.119.245.12	192.168.1.102	HTTP	1057	HTTP/1.1 200 OK (text/html)
17	7.305485	192.168.1.102	165.193.123.218	HTTP	625	GET /catalog/images/pearson-logo-footer.gif HTTP/1.1
20	7.308003	192.168.1.102	134.241.6.82	HTTP	609	GET /-kurose/cover.jpg HTTP/1.1
25	7.333054	165.193.123.218	192.168.1.102	HTTP	912	HTTP/1.1 200 OK (GIF89a)
54	7.589877	134.241.6.82	192.168.1.102	HTTP	1096	HTTP/1.0 200 Document follows (JPEG JFIF image)

3 request messages send by client browser

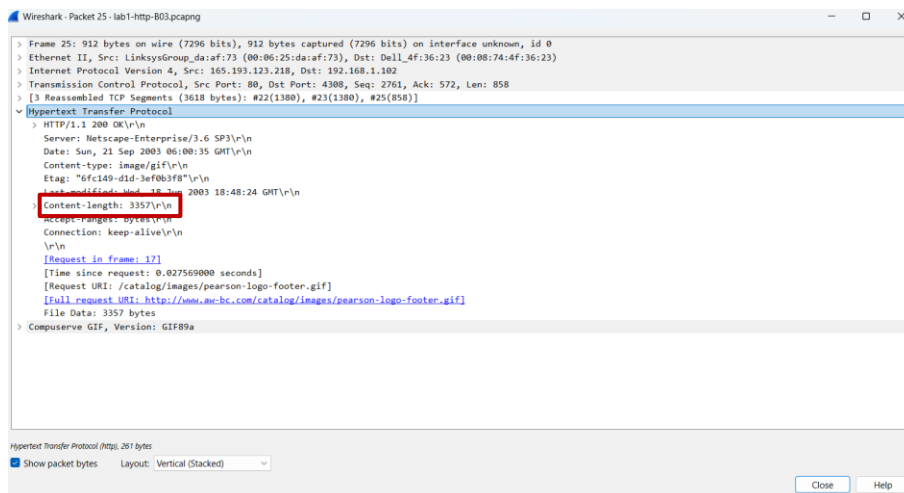

2. To which Internet addresses were these GET requests sent?

1st request were sent to 128.119.245.12.

2nd request were sent to 165.193.123.218

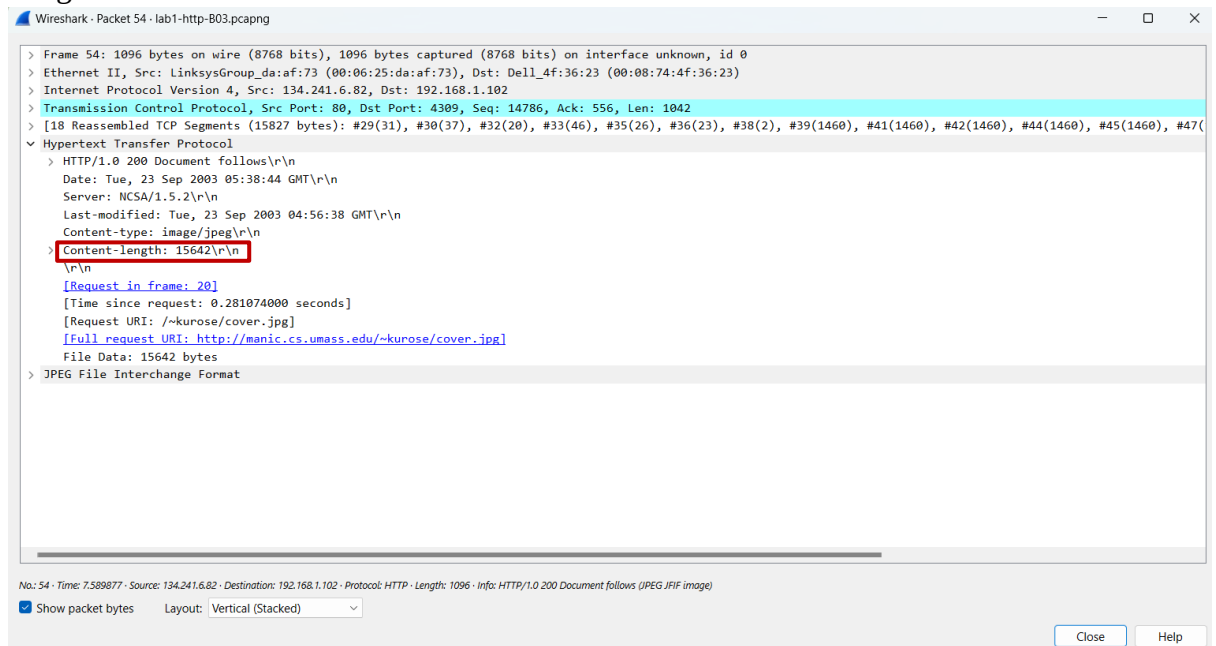

3rd request were sent to 134.241.6.82

3. any bytes of content are being returned to client browser for the **pearson-logo-footer.gif** image file?

3357 bytes

4. How many bytes of content are being returned to client browser for the **cover.jpg** image file?

15642 bytes

PART C: DNS Trace

1.0 nslookup

nslookup tool allows the host running the tool to query any specified DNS server for a DNS record. The queried DNS server can be a root DNS server, a top-level-domain DNS server, an authoritative DNS server, or an intermediate DNS server. To accomplish this task, nslookup sends a DNS query to the specified DNS server, receives a DNS reply from that same DNS server, and displays the result.

- To run it in Windows, open the Command Prompt (cmd) and run nslookup on the command line as shown in Figure C.1 and Figure C.2

```
C:\WINDOWS\system32\cmd.exe

C:\Users\pc-vastro220>nslookup yahoo.com
Server: ns1.utm.my

A (Host) Record . . . : 161.139.20.240

C:\Users\pc-vastro220>
```

Figure C.4: ipconfig /displaydns result

- Flushing the DNS cache clears all entries and reloads the entries from the hosts file.

Command: ipconfig /flushdns

```
C:\WINDOWS\system32\cmd.exe
C:\Users\pc-vastro220>ipconfig /flushdns

Windows IP Configuration

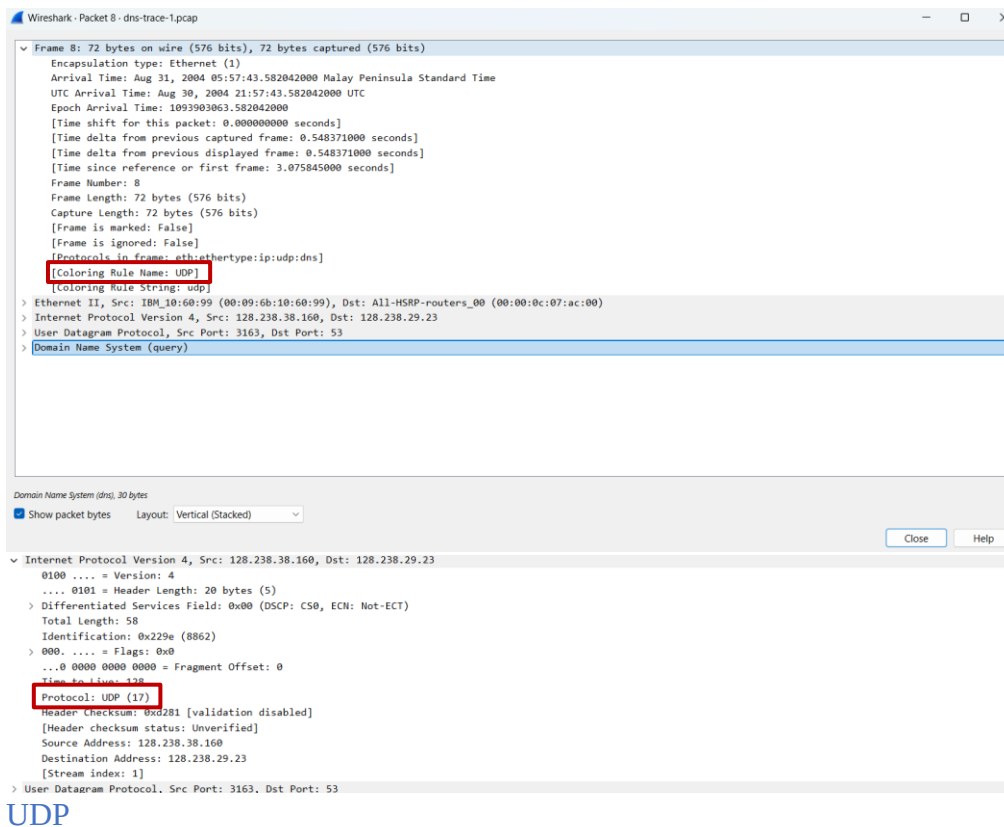

Successfully flushed the DNS Resolver Cache.

```

Figure C.5: ipconfig /flushdns result

3.0 Tracing DNS with Wireshark

- Open packet trace file dns-trace-1. Answer the following questions.
- 1. Locate the DNS query and response messages. Are then sent over UDP or TCP? Add screenshots in your answer.

- What is the destination port for the DNS query message? What is the source port of DNS response message? Add screenshots in your answer.

Destination port for DNS query message is 53

Source port of DNS response message is 53

- To what IP address is the DNS query message sent? Add screenshots in your answer.

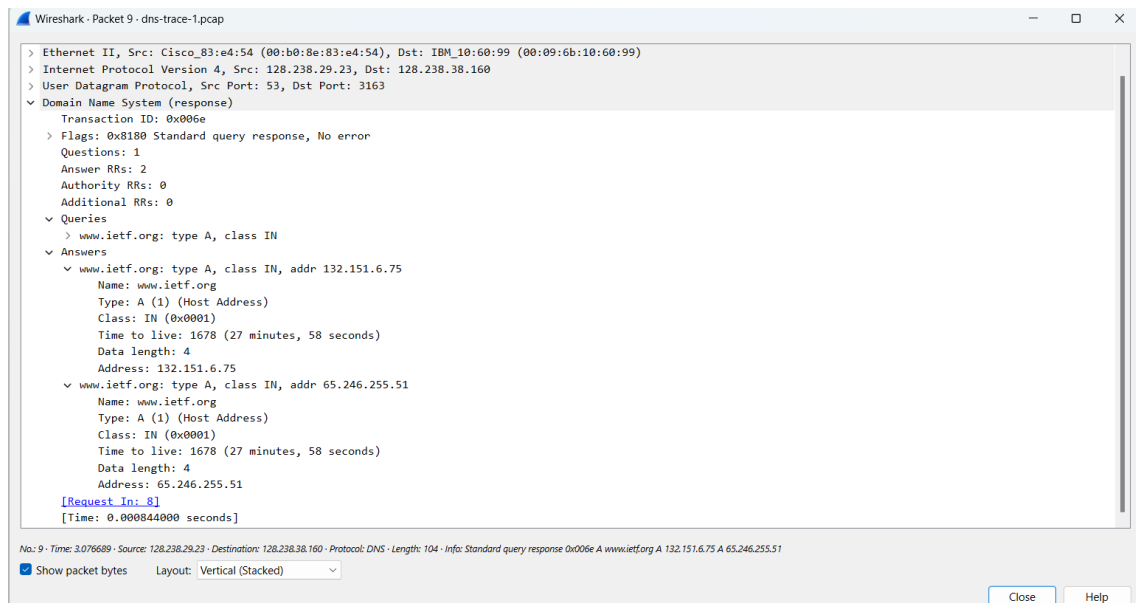

IP address is 128.238.29.23.

- Examine the DNS query message. What “Type” of DNS query is it? Does the query message contain any “answers”? Add screenshots in your answer.

The query message doesn't contain any "answers", and the DNS query is Type A

- Examine the DNS response message. How many "answers" are provided? What do each of these answers contain? Add screenshots in your answer.

The DNS response provides two answers, both containing information about `www.ietf.org`.

Each answer includes:

- Type: A (indicating an IPv4 address)
- Class: IN (Internet)
- Time to Live: 1678 seconds

- Data Length: 4 bytes

But the IP address provided is different indicates that `www.ietf.org` has multiple IP addresses, allowing for load balancing.

6. Consider the subsequent TCP SYN packet sent by your host. Does the destination IP address of the SYN packet correspond to any of the IP addresses provided in the DNS response message? Add screenshots in your answer.

▼ Answers

```
▼ www.ietf.org: type A, class IN, addr 132.151.6.75
  Name: www.ietf.org
  Type: A (1) (Host Address)
  Class: IN (0x0001)
  Time to live: 1678 (27 minutes, 58 seconds)
  Data length: 4
  Address: 132.151.6.75
```

Yes, the first SYN packet is sent to 132.151.6.75 (the IP address of the first reply that initiates a new connection between the client and the server), which corresponds to the first IP address provided in the DNS response message.

7. This web page contains images. Before retrieving each image, does your host issue new DNS queries?

No, the host does not issue a new DNS query until each image is retrieved. This is because DNS queries typically only query each domain name once in a session, or until the time to Live (TTL) value of the DNS record expires.

- Open packet trace file dns-trace-2 for nslookup.
- We see from Wireshark that nslookup actually sent three DNS queries and received three DNS responses. For the purpose of this lab, ignore the first two sets of queries/responses, as they are specific to nslookup and are not normally generated by standard Internet applications. You should instead focus on the last query and response messages.
- Answer the following questions.

8. What is the destination port for the DNS query message? What is the source port of DNS response message? Add screenshots in your answer.

The destination port for the DNS query message is 53.

The source port of DNS response message is 53.

9. To what IP address is the DNS query message sent? Is this the IP address of your default local DNS server? Add screenshots in your answer.

The DNS query message sent to 128.238.29.22. The IP address is not my default local DNS server. My local DNS servers are:

1. Primary DNS Server (IPv6): 2001:e68::b:68
2. Secondary DNS Server (IPv6): 2001:e68::b:69
3. IPv4 DNS Server: 192.168.0.1

```
C:\Users\braya>nslookup mit.edu
Server:      dns.tm.net.my
Address:     2001:e68::b:68

Non-authoritative answer:
Name:        mit.edu
Addresses:   2600:1417:4400:e89::255e
             2600:1417:4400:e80::255e
             23.35.126.95
```

```

```

10. Examine the DNS query message. What “Type” of DNS query is it? Does the query message contain any “answers”? Add screenshots in your answer.

The type of DNS query is type A(host address),and the query does not contain any “answers”.

11. Examine the DNS response message. How many “answers” are provided? What do each of these answers contain? Add screenshots in your answer.

1 “answer” are provided.This answer provides:

Name:www.mit.edu

Type:A(Host address)

Class:IN

Time to live:60(1 minute)

Data length:4

Address:18.7.22.83
